1995, 1996, 1997, 1998). Research in this field has been hampered by a number of factors, including a paucity of studies, the often poor quality of the studies, and the limited number of studies that have been published in the English language. The purpose of this review is to provide a comprehensive overview of the current state of research on the effects of the Internet on social skills and social behavior. The review is organized into three main sections: (1) a review of the literature on the effects of the Internet on social skills, (2) a review of the literature on the effects of the Internet on social behavior, and (3) a review of the literature on the effects of the Internet on social skills and social behavior. The review is based on a search of the literature using the following keywords: Internet, social skills, social behavior, and social skills and social behavior. The review is based on a search of the literature using the following keywords: Internet, social skills, social behavior, and social skills and social behavior.

Neuroprotection—apoptosis is a key event in neuronal death and is the target of many neuroprotective strategies. Apoptosis is a regulated process that involves the activation of specific proteases, including caspases, which lead to the degradation of cellular components and the formation of apoptotic bodies. Neuroprotection aims to prevent or delay the onset of apoptosis, thereby preserving neuronal function and structure. Various neuroprotective agents have been developed, including antioxidants, anti-apoptotic drugs, and neurotrophic factors. These agents can act at different stages of the apoptotic pathway, from the initial insult to the final execution phase. Neuroprotection is a promising approach for the treatment of neurodegenerative diseases, such as Alzheimer's disease, Parkinson's disease, and Huntington's disease, as well as for the recovery of neurons after stroke and trauma.
